Apply the installer by double-clicking the downloaded file. For compatibility reasons, the installer does not support 32-bit versions of Windows 10 or 8.1. Repairing From the start menu, click on Run, type regedit, and click OK. Navigate to the following registry key: HKEY_LOCAL_MACHINE\SOFTWARE\Classes\Installer The names of the extension files should be changed to the file name without the .exe extension. For example, VirtualDriver22.exe becomes VirtualDriver22. Edit the registry key and replace the virtual driver in the value name with the correct driver name and file path (a relative path to the driver should work in most cases, but if you need to hard-code an absolute path, just use the reg file name in that case). For example, if the name of the virtual driver is VirtualDriver22.exe, the name of the registry entry should be VirtualDriver22 The value name can be anything, for example VirtualDriver22 or myDriver. The value value should be the path of the driver that's being installed, for example C:\Drivers\VirtualDriver22. You can copy and paste this path in the registry editor to see what it actually is in the registry. Optional If you are not familiar with the Registry, you can refer to this. References Category:Windows componentsThis disclosure relates to a method and apparatus for gait analysis, and in particular, to an improved accelerometer arrangement for use in gait analysis. Gait analysis allows the objective, quantifiable evaluation of joint and muscle kinematics. This type of analysis can be used to detect conditions that may be precursors to injury, disabilities, or the development of injuries and disabilities. In particular, gait analysis is often used in the diagnosis and treatment of patients with stroke, Parkinson's disease, brain and spinal cord injury, multiple sclerosis, cerebral palsy, spina bifida, and the like. Gait analysis also assists in the diagnosis of and treatments for the osteoarthritic (degenerative) spine. Gait analysis is also used for postoperative evaluations following arthroplasty procedures, reconstructive procedures, and fractures. It is used to determine the potential for return to activity following surgery. Gait analysis is commonly performed using force plates (force sensors), two-dimensional goniometers (inertial measurement units 82157476a1
